The serious challenges to the implementation of the Programme for Rural Development in the new programming period 2014–2020 (PRD) raises due to the heavy demographic crisis of country and especially of the rural areas. This defines the purpose of the article. On the one hand, the main forecasts the expected total number of rural population incl. in sex-age groups by 2020 for six planning regions are presented and analyzed. On the other hand, recommendations regarding the need for urgent, complex and unusual measures to get out of the demographic crisis are made.

The component method of population is used for preparing the forecasts. Years from 2001 to 2010 are selected for basic period. The specific features of the statistical regions in relation to the rural demographic development are discovered. A further tendency of the rural population decrease and continuing village depopulation are contoured. This trend is typical for all planning areas but level and pace of ongoing demographic processes are different. The impact of population growth on demographic development in the rural areas will continue to have a dominant influence than the impact of migration processes.

The summarizing conclusions from analysis of the expected demographic situation in rural areas are derived. An attempt to lay down recommendations to solve this with essential, as complex and difficult problem is made. Among them is a reasonable idea of creating a special fund under certain requirements to help the demographic salvation of Bulgarian villages. Among them is motivated the idea of creating a special fund subject to certain requirements to help the demographic rescue of Bulgarian villages.

Key words: demographic forecast, rural population, planning regions, 2020.

EU enlargement creates new challenges and opportunities that affect the market for rail transport services. While new business opportunities are developed with the growth of international trade, they would have to oppose the policy of deregulation, which will impact both on current concepts of secure and protected national markets and the accelerated development of infrastructure of transport competitive modes, in particular rail passenger transport.

To compete in this new global business environment the railway companies in Bulgaria have no other alternative but to expand their business beyond national transport market in rail services, including in the new pan-European perspectives. This will allow them to focus on large amounts of new market segments.

To be successful this new business needed rail transport to reach the best economic performance and productivity of work. Achieving this goal requires an adequate and efficient railway infrastructure which will be able to meet the ever-increasing demands on the transport service by users - transport time, reliability and quality of transport services that meet the specific needs of customers.

Key words: railway transport, sustainability, competitiveness, regulatory, transport market, competitive procedures.

Possible Measures to Improve Science Funding
Albena Vutsova, Emil Mitov 82

Science funding as a share of the economy is a particularly important indicator of the quality and effectiveness of research, and at the same time gives a basis for comparison with the funds allocated in other countries. The main drawback of most studies examining the funding of science is that they provide abundant statistical information on the amount of funding, a percentage of GDP at home and abroad, good practices of funding in Western Europe and America, and a historical overview of the funding throughout the ages, but does not propose specific solutions to improve the current situation in Bulgaria.

The article attempts to examine the status of funding of science and its development over the years, and specific recommended activities that would alter the critical level of allocations and the trend of science funding in the country to be one of the lowest within the EU.

The purpose of this study is to propose possible and mostly admissible solutions that satisfy professional research staff and potential future investors, as well as revenue administration which actually applies the solutions.

The researched possible changes in legislation could raise funds by up to 16.6% of the current funds allocated for financing of science, without changing the predetermined budget for this. There are solutions that could partially be alleviated by changing the current state or additions to existing regulations in the field of taxation. Objects of this study are the laws related to taxation in Bulgaria and in particular the Law on Income Tax of Individual, Law on Corporate Income Tax, the Law on Value Added Tax, Enforcement Act Value Added Tax, the Law on Promoting Scientific Investments and how their changes would encourage investment in the industry.

Key words: financing, policies, instruments, funds, science.

Problems of Positioning the Bulgarian Tourism Product
Nikolay Tsonev 96

The article examines the problem of positioning Bulgaria as a tourist destination, particu-
larly certain Bulgarian tourist destinations. It is proved that the critical factors for success of positioning are preliminary studies and solutions: the right segmentation of real and potential customers; the exact choice and focusing on specific target groups; the preliminary study of the ideas which should be presented to these markets.

It was concluded that Bulgaria did not take an advantage of the systematic approach to segment, define the target segments and position the tourism product (both as a whole and as certain destinations). This chaos and fragmentation of efforts reduce the effects of the individual actions and the effect for the country as a whole. Dirigisme in positioning the county as a tourist destination and coordinating the efforts of different stakeholders are needed is what the thesis justifies.

Key words: positioning, segmentation, tourism product, tourist destination, systematic approach.

Evaluation of the Efficiency of Economic Activity of Inland Ports at the Bulgarian Section of the Danube River
Petya Koralova 109

The paper is devoted to the study of the efficiency of economic activity of inland ports at the Bulgarian section of the Danube River. In this regard a system of economic indicators (cargo turnover of Bulgarian river ports; total revenues; average number of persons employed; average stay of a vessel at inland ports; average wage costs and investment costs for maintenance and development of Bulgarian inland ports) will be analyzed. In the study is proposed a model for evaluation of the efficiency of ports traditional and complementary services. It is composed a rectangular matrix that reveals the correlations between indicating factors and performance indicators. As a result of the analysis are summarized the problems that hinder the economic activity of Bulgarian river ports and their superstructure and key measures for their development are proposed.

Key words: efficiency; inland ports; evaluation; performance indicators; influential factors.

Risks and Opportunities for the Supplementary Compulsory Pension Funds in Bulgaria
Jeko Milev 120

Supplementary compulsory pension funds have been operating for more than 10 years in Bulgaria. For the time being some of the risks facing the insured individuals came into surface. These financial institutions should start paying benefits in the near future to those individuals insured for early retirement and/or for an additional pension. That's why it is necessary to analyze the risks insured individuals could face and to distinguish between the upcoming reality and the myths surrounding pension funds in Bulgaria. The current article discusses some of the dangers concerning insured persons, demonstrates the investment results of the Bulgarian pension companies for the period 2002 – 2013 and proposes some recommendations for possible changes into the current normative rules, whose aim is to make the system more efficient than it is now. The aging of the population both in Bulgaria and in most of the countries in Europe makes necessary the implementation of reforms within the pay-as-you-go pension sys-
tems. At the same time the establishment of non-effective funded pillars could raise and not mitigate the future risks. There is one additional detrimental factor that should be taken into account within this complicated process – the significant increase of the public debt that accompanies the started transformation in most of the countries. This tempts the governments to use the assets of the pension funds for some short term rather than long term ends. The reversal of pension reforms in countries like Hungary and Poland makes it crucial to assess carefully the pro and cons of the pension fund activity by now and the factors that could trigger such processes in Bulgaria as well.

Key words: pension funds, investments, financial risks, insured individuals.

Directions for Development of Corporate Communications through Social Network Tools

Veselin Georgiev 127

The progress of information technology, particularly Internet and Web, in the last ten years and widespread usage by people gave precondition for constructing new communication and information channels. Simultaneously, enterprise needs for new flexible communication tools increases more and more, especially in areas of collocated work units, dynamic workflows, large corporate structures, the need for asynchronous and mobile methods of communication and collaboration allow entering technologies such as web 2.0 and social networks. Social networks provide the necessary range of resources for internal communication, combined with the potential of building social circles and groups are dominating as a useful and indispensable tool, displacing the email messages in asynchronous communication, phone and chat in synchronous. This way of interaction within corporations led to changes in work habits and approaches to interactions of employees on the one hand and on the other, allows all generated information in the process of collaboration between employees to be saved and used in the process of knowledge mining and stored as collective wisdom.

Key words: Social Networks, Corporate social networks, web 2.0, collective wisdom, wisdom of the crowd, BIS.

Projects to Increase Physical Security at Commercial Banks

Petya Biolcheva 138

The article discusses current issues related to the operation of commercial banks in Bulgaria. The increase in the number of bank robberies and a number of other threats to banking security dictate the need for increased physical protection. The article offers a methodology based on which you can develop projects to improve the physical security of banks and by that to increase their goodwill. The article successively describes the process of analyzing the environment, risk assessment, development and evaluation of projects in their specificity.

Key words: commercial banks, physical security, project, risk groups.
